Youtube Sentimental Analysis

Introduction

Sentimental Analysis involves the classification of human language sentences into predefined categories.

Our youtube comment sentimental analysis involves three categories namely positive , neutral and negative.

Introduction

Steps done

1. Scraped comment data via youtube api
2. Preprocessed the scraped data
3. Labelled the dataset with textBlob package

4. Naïve Bayes Model was trained
5. Model performance measured
6. Retraining and reevaluating model with some changes

Introduction

Scrapping

← → 🔍 🔍 Scrape

Scrapping

The First Attempt

Initial attempt was done with selenium which was very slow and unfeasible

The Second Attempt

Involved using the youtube api to get json of requested number of comments (16333)

Labelling TextBlob

Positive Comments

4609 comments were
labelled as positive

Neutral Comments

10865 comments were
labelled as neutral

Negative Comments

859 comments were
labelled as negative

The dataset is imbalanced

Model training

Remove special
characters

Remove stop words

Lemmatize instead of
stemming

Vectorize by bag of word

Results 3

Sampalled similar
number of each
category

Conclusion

The model with equally sampled training data performed the best for the classification task. This emphasises the analysis of dataset skewness before the model training steps
